Overall sequence quality assessment and vector trimming were conducted using the Lucy software (<http://www.tigr.org/softlab/>). Lucy parameters were set to ensure an overall trimmed quality of 97.5% or better without any vector fragments in the chosen high-quality region of each sequence. Low-quality bases between the poly-T and the high-quality region were replaced with N's to serve
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    BM337575 622 bp mRNA linear EST 16-JAN-2002 MEST209-C08.T3 ISUM5-RN Zea mays cDNA clone MEST209-C08 3', mRNA

rt). Overall sequence quality assessment and vector trimming were
conducted using the Lucy software (<http://www.tigr.org/softlab/>).
Lucy parameters were set to ensure an overall trimmed quality of
97.5% or better without any vector fragments in the chosen
high-quality region of each sequence. Low-quality bases between the
poly.T and the high-quality region were replaced with N's to serve
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            /note="vector: pT7T3PAC; Site_1: ECORI; Site_2: NOtI; /Tssues: Germinated seed and seedlings (1, 2, 8, 11 DAG), Mixed mature tissures (17, 21, 38, 69, 77 DAG), Kernels (3, 5, 10, 15, 20, 25, 30, DAP), Adventious roots (65 DAG), Tassel (13-39 cm, 53 and 56 DAG), Immature ear (0,2-3.0 cm, 53, 56, 59 DAG), Husk (73 DAG), Silk, unpollinated first ear, ear shank, etiolated seedlings, callus, Cycloheximide-treated callus, Anaerobic treated seedlings (27 DAG), NAA (a-Naphthalene acetic acid)-treated seedlings, ACPC.

Overall sequence quality assessment and vector trimming were conducted using the Lucy software (<http://www.tigr.org/softlab/>). Lucy parameters were set to ensure an overall trimmed quality of 97.5% or better without any vector fragments in the chosen high-quality region of each sequence. Low-quality bases between the poly-T and the high-quality region were replaced with N's to serve
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 1 (bases 1 to 659)

ACTOCARA TOTAL (A) A STANDARD TOTAL TOTAL TOTAL TO THE TESULTING DNA:RNA hybrid was treated with RNase H and used as a template for DNA Poll-catalyzed second strand synthesis. After the addition of EcoRI adaptors, the GS-CDNAs were digested with NotI and size-selected. The resulting molecules were directionally cloned into the EcoRI and NotI sites of the pTT3PAC vector. The library then went through one round of normalization to CoT value of 5 based on the methods of Marcelo Bento Soares (Genome 157 c 181 90 f.) 178 t.
                       molecules were generated as follows. First-strand cDNA was prepared from oligo-dT selected mRNA by priming with a NotI oligo-dT primer (5'

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 available on the World Wide Web.

(URL, http://www.sanger.ac.uk/Projects/M_tuberculosis/) CDS have been renumbered from the Original cosmid submissions but the old gene designations are in brackets after the new gene numbers.

Gene prediction was based on a Hidden Markov Model of TB genes implemented in TBpares (Krogh) supplemented with visual inspection of positional base preference in codons, especially where there is an increase in the observed/axpected third position G + C CAUTION: In some cases we may not have predicted the correct initiation codon. Where possible we choose an initiation codon (atg, 9tg, or ttg) which is preceded by an upstream ribosome binding site sequence (optimally 5-13bp before the initiation codon). If this cannot be identified we choose the most upstream initiation codon.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      tuberculosis sequencing and mapping teams, Sanger Centre, Wellcome Trust Genome Campus, Hinxton, Cambridge CB10 1SA Unite de Genetique Moleculaire Bacterienne, Institut pasteur, 28 rue du Docteur Roux, 75724 Paris Cedex 15, France E-mail: parkhill@sanger.ac.uk On Jun 27, 1998 this sequence version replaced g1:2143285.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              /note="Rv0654, (MTC1376.22), len: 501. unknown, FASTA score: 053353 LIGNOSTILBENE-ALPHA, BETA-DIOXYGENASE (485 aa) opt: 280 z-score: 330.1 E(): 2.3=11, (28.5% identity in 523 aaoverlag).                                                                                                       // Anotes Westor: Landon All: Bacilli were disrupted using a Mini bead beater (Biospec). RNA was isolated using the RNeasy protocol (Qiagen). Purified RNA was subjected to 2 rounds of digestion with RNase-free DNase I (Promega). DNase I was heat-inactivated at 750C for 5 min. and removed by using RNeasy columns followed by phenol extraction and ethanol precipitation. The RNA preparations were confirmed to be free of genomic DNA contamination by carrying out PCR and RT-PCR using the Access kit (Promega) and primers specific for the histone-like protein gene hip (Lee et al., 1998). cDNA was synthesized using random hexamer primers (Promega) and Stratagene's cDNA synthesis kit. CDNA fragments were ligated into lambda ZAP II vector and packaged in vitro using Stratagene reagents.

BM601475 665 bp mRNA linear EST 25-FEB-2002 17000659084020 A.Gam.ad.cDNA.bloodl Anopheles gambiae cDNA clone 19600447016323 5', mRNA sequence.
                                                                                                                                                                                                                                                                                                                                                        ö
designed to allow plasmid rescue from total genomic DNA. Mu elements insert preferentially into transcription units. For more information on RescueMu, go to the web site 'www.zmb.iastate.edu' and follow the links for 'RescueMu.' Grid K was grown at Molokai, Hawaii in Winter 2000-2001. DNA was extracted from leaf punches, double digsteed using BamHI and BglII, and ligated to form circular plasmids. DH10B cells were transformed and then screened on LB plates with ampicillin."

/clone_lib="Rabbit Osteoclast, Dennis Sakai"
//lab_host="E. coli DH12S"
//lab_host="E. coli DH12S"
//note="Vector: pSPORTI; Site_1: Sal1; Site_2: NotI; Poly(A
)+ RNA was purified from a 97% pure population of
osteoclasts prepared from the long bones of 10 day old
rabbits. First strand cDNA was synthesized by priming
with an oligo(dT)-NotI anchor-primer and second strand
cDNA was synthesized by replacement synthesis as described
by Gubler and Hoffman (Gene 25:283, 1983). Following the
addition of Sal1 adapters and NotI digestion, the cDNA was
cloned between the Sal1 (30) and NotI (30) sites of the
pSPORTI (BRL) plasmid vector."

Bevelopment of a genetically and physically anchored EST resource for barley genomics: Blumeria infected incompatible (Mial3)

AL Unpublished (2001)

AL On Nov 17, 2000 this sequence version replaced gi:11195846.
with an oligo(dT)-NotI anchor-primer and second strand cholms was synthesized by replacement synthesis as described by Gubler and Hoffman (Gene 25:283, 1983). Following the addition of SalI adapters and NotI digestion, the cDNA was cloned between the SalI (50) and NotI (30) sites of the pspoRTI (8RL) plasmid vector."
                                                                                                                                                                                                                                                   ö

) of Blumeria graminis f. sp. hordei, and leaves were harvested 20 and 24 hr post-inoculation and snap frozen; uninoculated leaves were harvested 20 hr post-inoculation (Wei, Mise). In the TJ Close lab at the University of California, Riverside, total RNA was prepared from each sample pool, equal quantities of all three RNA pools were combined, poly(A) RNA was purified from the mixture, one CDNA ilbrary was made, and I million pfu were in vivo excised to give pBluescript SK(-) cDNA phagemids (Choi, Close). Phagemids were plated and picked at the Clemson University Genomics Institute (CUGI) (Begum, Palmer, Frisch, Atkins and Wing). Plasmid DNA preparations, DNA sequencing and sequence analysis were performed at CUGI (Wing, Yu, Frisch, Henry, Simmons, Oates, Rambo, Maln). The sequence has been trimmed to remove vector sequence and contains a minimum of 100 bases of phred value 20 or

Site_1: EcoRI: Site_2: XhOi; Plants were grown under
Site_1: EcoRI: Site_2: XhOi; Plants were grown under
hydroponic conditions at UC Davis, salt stressed for 12
hours, and for 7 days, then dissected and frozen (Akhunov
in J Dorak Lab). Total RNA was prepared from sheath
tissue, equal quantities of RNA were pooled from the two
samples, polyA was purified from the pooled from the two
samples, polyA was purified from the pooled from the two
samples, polyA was purified from the pooled RNA, a cDNA
library was made, and the CDNA clones were in vivo
exclsed to give pbluescript phagemids in the TJ Close lab
at the University of California, Riverside (Akhunov, Chin
'Chol. Close, Fenton, Kianian, Otto, Simons, Zhang).
Plasmid DNA preparations and DNA sequencing were
performed in the Ob Anderson and all others

Patent No. US20020102713A1

GENERAL INFORMATION:
APPLICANT: SUZUKI, Shunichi
APPLICANT: VOKOZEKI, Kence
TITLE OF INVENTION: 5-SUBSTITUTED HYDANTOIN RACEMASE, DNA CODING FOR THE RACEMASE,
TITLE OF INVENTION: 5-SUBSTITUTED HYDANTOIN OPTICALLY ACTIVE AMINO ACIDS
FILLE REFERENCE: 212131805
CURRENT APPLICATION NUMBER: US/09/950,772

CURRENT FILING DATE: 2001-09-13
                                                                                                                                                                                                                                                                      Sequence 5, Application US/09887052

Sequence 5, Application US/09887052

Sequence 3598, Application US/09878574

Patent No. US20020110548A1

GENERAL INFORMATION:

APPLICANT: Byrum, Joseph R.

APPLICANT: La Rosa, Thomas J.

APPLICANT: Thompson, Michael D.

TITLE OF INVENTION: Nucleic Acid Molecules and Other Molecules Associated With TITLE OF INVENTION: Nucleic Acid Molecules and Other Molecules Associated With TITLE OF INVENTION: UNDER: US 109/09/0878,574

CURRENT FILING DATE: 2001-12-21

PRIOR APPLICATION NUMBER: 09/333,535

PRIOR APPLICATION NUMBER: 09/333,535

PRIOR APPLICATION NUMBER: 1999-06-14

NUMBER OF SEQ ID NOS: 15775

Sequence 2475, Application US/09923876

Patent No. US2002001395841

GENERAL INFORMATION:

APPLICANT: Lalgudi, Raghunath V.

APPLICANT: Lalgudi, Laura Y. (Ito)

APPLICANT: Sherman, Bradley K.

TITLE OF INVENTION: POLYNUCLEOTIDES AND POLYPEPTIDES DERIVED FROM CORN SEEDLING
FILE REFERENCE: DL-0012-1 CON

CURRENT APPLICATION NUMBER: US/09/923,876

CURRENT APPLICATION NUMBER: 09/298,329

PRIOR FILING DATE: 1999-04-21

PRIOR APPLICATION NUMBER: 60/085,331

PRIOR PILING DATE: 1999-06-05

NUMBER OF SEQ ID NOS: 6332

SOFTWARE: PERL PROFram
